

TRACKS & DESCRIPTION

Reimagining Education at Scale: Using data and AI to improve learning, career guidance, skill planning, and access to education across large and diverse populations.

Trust, Discovery & Intelligence in Social Media: Improving how media is verified, discovered, organized, and maintained across platforms using intelligent systems.

Social Compliance & Supply Chain Infrastructure: Building systems that increase transparency, accountability, and regulatory compliance across complex supply chains.

Health, Care & Access: Supporting safer, more accessible, and better-coordinated healthcare through responsible decision support systems.

Sponsored Tracks: Problem Statements provided by our sponsors will appear here. Explore unique problem statements from our sponsors and create innovative solutions that drive real-world transformation.

TRACK: Reimagining Education at Scale

1. LLM-Powered Scholarship Intelligence & Eligibility Platform

Problem Statement:

Design an LLM-powered system that evaluates user eligibility for government, institutional, and private scholarships by interpreting unstructured guidelines and reasoning over complex eligibility criteria to deliver clear, explainable outcomes, *utilizing MegaLLM*.

2. Intelligent Career Counsellor & Skill Obsolescence Forecasting System

Problem Statement:

Build an intelligent system that analyzes a user's skills and career goals against evolving industry trends to identify declining skills, forecast future relevance, and recommend adaptive learning or career pathways.

3. Adaptive Gamified Learning Platform

Design an intelligent learning system that dynamically adapts challenges, simulations, and collaborative activities based on real-time learner performance and behavior, continuously adjusting difficulty, pacing, and feedback to maximize concept mastery and long-term retention at scale.

4. Inclusive Education & Accessibility Enablement System

Create an AI-driven accessibility system that analyzes educational content and learner interaction patterns to automatically transform lessons into multiple accessible formats such as simplified language, audio narration, visual restructuring, or alternative interaction modes, ensuring effective participation for learners with diverse cognitive, sensory, and physical needs.

TRACK: Trust, Discovery, and Intelligence in Social Media

1. Video Authenticity & Trust / Fingerprinting

Create an advanced AI-based content fingerprinting system that generates robust, tamper-resistant audio-visual signatures for films, enabling real-time identification and suppression of pirated content across social platforms, messaging networks, and streaming ecosystems.

2. Smarter Assets Discovery

Create an intelligent media discovery system that helps users find audio and video content based on meaning, context, or intent rather than keywords or manual tags.

3. Assets Quality & Consistency Across Sources

Design a system that analyzes and normalizes audio and video captured from multiple devices, locations, and formats to produce a consistent, broadcast-ready output by dynamically correcting differences in resolution, color, audio levels, and synchronization across sources.

4. AI Orchestration for FilmMaking

Design an Intelligent Creative Orchestration Engine that acts as a bridge between abstract human intent and final media output. The system should reason over a high-level prompt (e.g., a script, a storyboard, or a theme) and autonomously manage the complex lifecycle of asset generation, consistency checks, and assembly.

TRACK: Social Compliance & Supply Chain Infrastructure

1. AI-Powered Tariff & Trade Optimization System

Create an AI-driven trade intelligence system that analyzes product descriptions, country-of-origin rules, and tariff schedules to estimate total landed cost and recommend compliant import/export classifications and routing strategies that reduce duty exposure while maintaining regulatory alignment.

2. Regulatory Intelligence & Impact Forecasting Platform

Design an AI-assisted regulatory intelligence system that monitors public policy documents and regulatory updates to detect emerging compliance themes, map them to affected industries or operational areas, and generate explainable impact projections on business processes and workforce skill requirements.

3. Consumer-Grade Product Origin & Authenticity Verification

Consumers lack a reliable way to independently verify a product's origin, handling, and authenticity across complex supply chains. Build a system that enables transparent, verifiable access to a product's provenance for end users, benefiting consumers, ethical brands, marketplaces, and regulators.

4. Reducing Time Lag in Detection of Supply Chain Violations

Most compliance violations in manufacturing and logistics environments are identified weeks or months after they occur, limiting corrective action and increasing systemic risk. Design a solution that enables early detection and timely visibility of violations, benefiting workers, enterprises, compliance teams, and enforcement authorities.

TRACK: Health, Care & Access

1. Claims Intelligence & Fraud Detection

Design an AI-assisted claims intelligence system that analyzes structured billing data alongside unstructured claim notes and justification documents to detect anomalous patterns, documentation inconsistencies, and potential indicators of fraud or error. The system must provide transparent, explainable reasoning for flagged cases and operate strictly as an advisory tool, without making automated enforcement or legal decisions. All solutions must use synthetic or publicly available datasets.

2. Ritual–Food Metabolic Calculator

Design an LLM-based metabolic reasoning engine that processes synthetic biometric data, regional festival calendars, and traditional food compositions to calculate ritual-safe food quantities personalized to the user, utilizing MegaLLM. The system must reason over cultural context, not just calories, to generate actionable guidance like “safe laddoo quantity for Maharashtrian digestion during Ganesh Chaturthi.”

3. Nurse Shift Handoff Disaster Prevention

Build an LLM-powered nurse handoff intelligence system that converts real nurse audio handoffs into structured summaries, reasons over timelines and medication effects, and automatically flags high-risk inconsistencies with explainable alerts. The LLM must interpret unstructured clinical speech—not just transcribe it—to support safe, continuous patient care.

4. Rural Referral Chaos Optimizer

Design an LLM-driven referral orchestration system that reasons over synthetic real-time infrastructure data across rural health facilities to recommend the optimal referral path based on availability, distance, urgency, and transport feasibility. The LLM is required to synthesize fragmented signals into a single, explainable referral decision.

Sponsored Tracks

AI-Driven Economic Resilience Optimization with Coca-Cola

Design an AI-powered system for coca-cola that uses real-time sales, market trend, and promotion data to forecast demand more accurately and optimize production and distribution planning across regions.
